Abstract

The invention relates to a stop device for a spindle drive, which consists of a threaded spindle (1) and a spindle nut (2) with a stop (3), comprising a limit stop (4) and also a faceplate (5). The faceplate (5) of the stop device according to the invention is arranged between the stop (3) of the spindle nut (2) and the limit stop (4), the limit stop (4) and the stop (3) of the spindle nut (2) being offset in relation to one another and being able to act upon the faceplate (5) such that a bending moment can be applied to the faceplate (5) when the threaded spindle (1) and spindle nut (2) of the spindle drive are in a limit stop position relative to one another.
